

# Course Practical Assignment

*Josep Clotet Ginovar*

*Èric Martín Obispo*

## Bank client data

### Description of input variables:

1. age (numeric)
2. job : type of job (categorical: 'admin', 'blue-collar', 'entrepreneur', 'housemaid', 'management', 'retired', 'self-employed', 'services', 'student', 'technician', 'unemployed', 'unknown')
3. marital : marital status (categorical: 'divorced', 'married', 'single', 'unknown'; note: 'divorced' means divorced or widowed)
4. education (categorical: 'basic.4y', 'basic.6y', 'basic.9y', 'high.school', 'illiterate', 'professional.course', 'university.degree', 'unknown')
5. default: has credit in default? (categorical: 'no', 'yes', 'unknown')
6. housing: has housing loan? (categorical: 'no', 'yes', 'unknown')
7. loan: has personal loan? (categorical: 'no', 'yes', 'unknown')# related with the last contact of the current campaign:
8. contact: contact communication type (categorical: 'cellular', 'telephone')
9. month: last contact month of year (categorical: 'jan', 'feb', 'mar', ..., 'nov', 'dec')
10. day\_of\_week: last contact day of the week (categorical: 'mon', 'tue', 'wed', 'thu', 'fri')
11. duration: last contact duration, in seconds (numeric). Important note: this attribute highly affects the output target (e.g., if duration=0 then y='no'). Yet, the duration is not known before a call is performed. Also, after the end of the call y is obviously known. Thus, this input should only be included for benchmark purposes and should be discarded if the intention is to have a realistic predictive model.
12. campaign: number of contacts performed during this campaign and for this client (numeric, includes last contact)
13. pdays: number of days that passed by after the client was last contacted from a previous campaign (numeric; 999 means client was not previously contacted)
14. previous: number of contacts performed before this campaign and for this client (numeric)
15. poutcome: outcome of the previous marketing campaign (categorical: 'failure', 'nonexistent', 'success')# social and economic context attributes
16. emp.var.rate: employment variation rate - quarterly indicator (numeric)
17. cons.price.idx: consumer price index - monthly indicator (numeric)
18. cons.conf.idx: consumer confidence index - monthly indicator (numeric)
19. euribor3m: euribor 3 month rate - daily indicator (numeric)
20. nr.employed: number of employees - quarterly indicator (numeric)
21. y - has the client subscribed a term deposit? (binary: 'yes', 'no')

## Inicialització del control d'errors, missings i outliers:

```

columnes <- names(df) #list of column names

# creem 3 dataframes inicialitzats a 0 d'una fila amb les columnes de la nostra mostra;
# en ells hi posarem el nombre d'errors, missings i outliers per a cada variable
errors <- data.frame(matrix(0, ncol = length(columnes), nrow = 1))
colnames(errors)<-columnes

missings <- data.frame(matrix(0, ncol = length(columnes), nrow = 1))

```

```
colnames(missings)<-columnes

outliers <- data.frame(matrix(0, ncol = length(columnes), nrow = 1))
colnames(outliers)<-columnes

# columnes que portaran el control per individu:
df$num_missings <- 0
df$num_outliers <- 0
df$num_errors <- 0
```

## UNIVARIATE DESCRIPTIVE ANALYSIS (to be included for each variable):

Aquí estudiem cada variable buscant missing values, outliers i possibles errors. En el cas que en trobem, els transformem en NAs i procedim a una imputació manual o els eliminem, o una imputació automàtica (en un chunk posterior d'Imputation).

## QUALITATIVE VARIABLES.

També factoritzem aquí les categories (levels) de les variables qualitatives (discretes).

### Job

Jobs "unknown" són considerats com a categoria.

```
# Jobs "unknown" will be considered a category, not a missing value.
table(df$job, useNA="always")

##
##      admin.    blue-collar  entrepreneur    housemaid    management
##      1234      1154         155          135          413
##      retired self-employed    services    student    technician
##      205        149         500         100         794
##      unemployed    unknown      <NA>
##      122          39          0

# Missings:
miss<-which(is.na(df$job));
missings$job<-length(miss); length(miss)

## [1] 0

df[miss, "num_missings"]<- df[miss, "num_missings"]+1

# Factoritzem les categories (levels) de la columna i afegim l'etiqueta "job-":
df$job<-factor(df$job)
levels(df$job)<-paste0("job-",levels(df$job))

pie(summary(df$job))
```

## Marital

Els “unknowns” seran imputats més endavant automàticament.

```
# Marital "unknown" will be a missing value (set to NA):
sel<-which(df$marital=="unknown");length(sel)
```

```
## [1] 10
```

```
df$marital[sel]<-NA
```

```
# Missings:
```

```
miss<-which(is.na(df$marital));
missings$marital<-length(miss); length(miss)
```

```
## [1] 10
```

```
df[miss, "num_missings"]<- df[miss, "num_missings"]+1
```

```
# Factoritzem les categories (levels) de la columna i afegim l'etiqueta "marital-":
```

```
df$marital<-factor(df$marital)
levels(df$marital)<-paste0("marital-",levels(df$marital))
summary(df$marital)
```

```
## marital-divorced marital-married marital-single      NA's
##           556           3053           1381           10
```

```
pie(summary(df$marital))
```

## Education

Education “unknown” és considerada com a categoria. La categoria “illiterate” és inclosa manualment a “basic.4y”.

*# Education “unknown” will be considered a category, not a missing value.*

```
table(df$education, useNA="always")
```

```
##
##      basic.4y      basic.6y      basic.9y
##      513        291        716
##      high.school      illiterate professional.course
##      1171           3        602
##      university.degree      unknown      <NA>
##      1472          232          0
```

*# Illiterates are consired as basic.4y.educated:*

```
sel<-which(df$education=="illiterate");length(sel)
```

```
## [1] 3
```

```
df[sel, "education"]<-"basic.4y"
```

*# Missings:*

```
miss<-which(is.na(df$education));
missings$education<-length(miss); length(miss)
```

```
## [1] 0
```

```
df[miss, "num_missings"]<- df[miss, "num_missings"]+1

# Factoritzem les categories (levels) de la columna i afegim l'etiqueta "education-":
df$education<-factor(df$education)
levels(df$education)<-paste0("education-",levels(df$education))

pie(summary(df$education))
```

### Default (has credit in default?)

Default (owes credit) “unknown” will be considered a category, not a missing value.

```
table(df$default, useNA="always")

##
##      no unknown      yes    <NA>
##    3966    1034         0        0

# Missings:
miss<-which(is.na(df$default));
missings$default<-length(miss); length(miss)
```

```
## [1] 0
```

```
df[miss, "num_missings"]<- df[miss, "num_missings"]+1

# Factoritzem les categories (levels) de la columna i afegim l'etiqueta "default-":
df$default<-factor(df$default)
```

```

levels(df$default)<-paste0("default-",levels(df$default))

par(mfrow=c(2,2))
pie(summary(df$default))

```

## Housing

Housing “unknown” will be considered a category, not a missing value.

```
table(df$housing, useNA="always")
```

```
##
##      no unknown      yes    <NA>
##    2219      137    2644      0
```

```
# Missings:
```

```
miss<-which(is.na(df$housing));
missings$housing<-length(miss); length(miss)
```

```
## [1] 0
```

```
df[miss, "num_missings"]<- df[miss, "num_missings"]+1
```

```
# Factoritzem les categories (levels) de la columna i afegim l'etiqueta "housing-":
```

```
df$housing<-factor(df$housing)
levels(df$housing)<-paste0("housing-",levels(df$housing))
```

```
pie(summary(df$housing))
```

### Loan (has personal loan?)

Loan “unknown” will be a missing value (set to NA) i serà imputat més endavant automàticament.

```
sel<-which(df$loan=="unknown");length(sel)
```

```
## [1] 137
```

```
df$loan[sel]<-NA
```

```
# Missings:
```

```
miss<-which(is.na(df$loan));
```

```
missings$loan<-length(miss); length(miss)
```

```
## [1] 137
```

```
df[miss, "num_missings"]<- df[miss, "num_missings"]+1
```

```
# Factoritzem les categories (levels) de la columna i afegim l'etiqueta "loan-":
```

```
df$loan<-factor(df$loan)
```

```
levels(df$loan)<-paste0("loan-",levels(df$loan))
```

```
pie(summary(df$loan))
```

## Contact

```
summary(df$contact)
```

```
## cellular telephone
##      3130      1870
```

```
# Missings:
```

```

## DATA QUALITY REPORT:

Per variable:

```
par(mfrow=c(3,1))
barplot( t(c(missings[, 3])), main="total missings per variable", xlab="marital")
barplot( t(c(outliers[, c(1, 11, 12, 13)])), main="total outliers per variable")
barplot( t(c(errors[, 13])), main="total errors per variable")
```

## Per individu:

Cap individu en té més d'un. Es mostra en format taula el número d'individus que tenen 0 i/o 1(o més) missings, errors i outliers. Per últim, es mostren els individus que han tingut algun outlier i que aquest ha estat imputat.

## IMPUTATION:

### Factors:

De totes les variables discretes que hem analitzat, hem vist que el “marital” status es podria imputar fàcilment amb `imputeMCA()`, ja que els unknown (passats prèviament a NA) corresponen només una petita part de la mostra. El mateix fem amb la variable “loan”. Com hem vist prèviament, els unknowns han estat considerats categoria pròpia en altres variables.

```
